monoclonal antibodies, commercially produced diagnostic kits or reagents were impractical-good polyclonal antisera were in very short supply, being produced, with a huge investment in time and effort, in small quantities by individual laboratories for their own use [6]. There was never a surplus, at any price, for any commercial enterprise to contemplate marketing kits based on them. Moreover, the realistic cost of such sera would have made any such kit unacceptably expensive for routine use. Monoclonal antibodies completely changed the ground rules. Such patients are increasingly managed in district hospitals, but specialist virology has to be close at hand for this to be done properly. Principles and practice of clinical virology, 3rd edn. The Hadassah University Hospital Clinical Virology Laboratory (CVL) is located at the Hadassah University Hospital, within a new central laboratory facility of approximately 2,400 square meters. Our facility boasts state-of-the-art laboratories, modern offices, break and conference rooms, as well as glassware wash, dry, and autoclave facilities. It is designed and equipped to perform tissue culture, virological, biochemical, and molecular biology research and diagnostic virology work. The Clinical Virology Laboratory has been categorized as Biosafety Level 2 (BSL2), with the capacity to be cat "The book comprehensively covers, in simple language, viral illness, diagnostic methods, and other important issues with viral infections in the healthcare environment. The information is uniquely provided in concise charts, diagrams, and algorithms....The understanding of diagnostic techniques and when to apply them is this book's strength....This book finally provides a necessary guide to vast and confusing array of diagnostic tests." - Doody's Review Service.
